					Caterpillars	Mavrik	McGregors General	Mavrik	Pyrethrum	

Notes:

1. This chart has been prepared on the basis of products that are approved and registered for the specified crops and diseases / pests. However, in addition this chart includes a small number of 'off label' recommendations (highlighted in pale brown) which although not registered for are commonly used based on extrapolation. Where the chart indicates 'nothing available' - this means there is no effective treatment that is registered for use on the specified crop.
2. The chart has also been prepared on the basis of products that are available in home garden size packs, which do not require a qualified registered handler, and special storage facilities.
3. Products approved by organic growers are listed separately. It must be pointed out that many of these products are much less effective, requiring more frequent application, often resulting in greater residues. Some organic growers use products that are natural plant extracts but are not registered / approved and are in fact toxic.
4. Pesticides in home garden packs are mostly low toxicity. McGregors General Insect spray containing diazinon, and Kiwi Care Spectrum, (chlorpyrifos) are the only products of significant toxicity.
5. Actual trade names have been used to make it easier for home gardeners to find the product.
6. Many gardeners with very large gardens may well consider purchasing commercial size packs from horticultural suppliers in which case there is a much larger range of products to select from.
7. Always consult the label for withholding periods for each product and each different crop.
